C -1- SIMILARITY: TO OTHER PROTEIN TYROSINE KINASES IN THE CATALYTI CONTAINS TO THE EMPRIN TECEPTOR FRAILY.

C -1- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.

C -1- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

J. Physiol. 274:H331-H341(1998).

-i FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMIL EPHRIN-A2, -A3, -A4 AND -A5.

-i CATALUTIC ACTIVITY: ATP + A PROTEIN TYROSINE ~ ADP + PROTEIN TYROSINE PHOSPHATE.

-i SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-i SUBCELLULAR LOCATION: TYPE I MEMBRANE ROTEIN.

-i SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.

-i SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transferase; Tyrosine-protein kinase; ATP-binding; Phosphorylation; Receptor; Transmembrane; Glycoprotein; Signal.

BINDS TO EPHREN-A2, -A3, -A4 AND -A5.
CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +
PROTEIN TYROSINE PHOSPHATE.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
ALTERNATIVE PRODUCTS: A SECRETED VARIANT WITHOUT THE TRANSMEMBRANE REGION AND THE KINASE DOMAIN IS PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TISSUE SPECIFICITY: GREATEST LEVELS OF EXPRESSION OCCURRING IN

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATI
DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MGI:10803

FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. EPHRIN-A1, -A4 AND -A5. BINDS MORE POORLY TO EPHRIN-A2 CATALYTIC ACTIVITY: ATF + A PROTEIN TYROSINE - ADF + PROTEIN TYROSINE PHOSPHATE.

SUBJECTIOUR TO THE PROTEIN TYPE I MEMBRANE PROTEIN.

SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAIN SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         VNNSKEEDPPRMYCSTEGEWLVPIGKCSCNAGYEERGFMCQ

TISSUE SPECIFICITY: WIDELY EXPRESSED IN EMBRYO. IN ADULT, EXPRESSION RESTRICTED TO HIPPOCAMPUS, TESTIS AND SPLEEN. EXPRESSION FOR PROTEIN-TYROSINE KINASES IN THE CATAL DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.

SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BE EPHRIN-A1, -A2, -A3, -A4 AND -A5.

EPHRIN-A1, -A2, -A3, -A4 AND -A5.

CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP + PROTEIN TYROSINE PHOSPHATE.

PROTEIN TYROSINE PHOSPHATE.

SUBCELLULAR LOCATION: TYPE I MEMBERS OF THE PROTEIN (MDK1, MI ALTERNATIVE PRODUCTS: FIVE FORMS OF THE PROTEIN (MDK1, MI MDK1-2, MDK1-TAD MDK1-T2) ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE. THE SEQUENCE SHOWN HERE IS THE SPLICING OF THE SAME GENE. THE SEQUENCE SHOWN HERE IS THE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
ALTERNATIVE PRODUCTS: TWO FORMS ARE PRODUCED BY ALTERNATIVE
SPLICING, THE TRUNCATED FORM LACKS THE KINASE DOMAIN. THE LONG
FORM IS MORE WIDELY EXPRESSED IN THE EMBRYO.
TISSUE SPECIFICITY: RESTRICTED TO THE NERVOUS SYSTEM.
SIMILARITY: TO OTHER PROTEIN-TYPOSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EPHRIN-A1, -A2, -A3, -A4 AND -A5.
CATALYTIC ACTIVITY: ATP + A PROTEIN
PROTEIN TYROSINE PHOSPHATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FROM N.A.

A. Pitle: Ehk-1 and Ehk-2: two novel members of the Eph A; Reference number: S49015; MUID:94067777

A. Accession: S51604

A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-981 < MAID:
A; Cross-references: EMBL:S68029

A; Cross-references: EMBL:S68029

A; Note: the authors translated the codon GAC for resid C; Superfamily: protein-tyrosine kinase, receptor type C; Keywords: ATP; transmembrane protein
F; 651-917/Domain: protein kinase ATP-binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A; Molecule type: mRNA

ALIGNMENTS

```
Receptor-type tyrosine kinase reactive with monoclonal antibody III-A4 - is EPH-ELK-like kinase, useful for phosphorylating proteins in modulating pre-B, B and T cell function, in cancer therapy etc.

Claim 6; Fig 1; 58pp; English.

This sequence represets human eph/elk-like kinase (HEK). HEK is expressed in both pre-B cells and T cell lines and in a number of tumours of human origin, eg. lymphoid tumours LKG3, Lila-l and JM, and the epithelial tumour HeLa. This receptor-type thymiddine kinase (TK) and/or its ligands are useful as agents in modulation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HEK polypeptide.

Probes derived from the EPH-related PTKs Cek4 (090659) and Ce (090660) were used to isolate novel cDNA clones (090652-58, 090661-62) from chicken embryo and embryonic brain libraries. Cek4 is highly expressed in the chicken developing brain and embryonic tissues and also in the adult brain and retina. Sequence 983 AA;

DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. The bpTKS, bpTK1, bpTK2, bpTK3, bpTK4, bpTK5 and bpTK7 (R85924-28 and R85935, respectively) are expressed in human brain tissue and show homology to known pTKs. A full-length sequence for bpTK7 (R85936) was also obtd. bpTK7 can be used to design drugs that modulate pTK activity. Sequence 986 AA;
Claim 18; Page 62-65; 133pp; English.

4 Novel human EPH-11ke receptor profesin tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (T02946-49) from a human foetal brain cDNA library. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Wood

                      Claim 1; Fig 2; 72pp; English.

Claim 1; Fig 2; 72pp; English.

The present sequence represents mouse Bsk, which is a receptor-like tyrosine kinase. The nucleic acid sequence encoding Bsk can be used in Bsk nucleic acid probes, which can be used in detecting alterations in the level of Bsk messenger-RNA (mRNA) in biological samples isolated from a mammal afflicted with a disease, such as neurodegenerative diseases or disorders and neoplasms. The nucleic acid sequence can also be delivered into the limbic system of patients with limbic system neurodegenerative disease, disorder or injury, to promote or enhance limbic system neuron regeneration or growth. Such neurodegenerative diseases include, chromosomal abnormalities, degenerative growth and development disorders, viral infections, bacterial infections, brain injuries, neoplastic conditions, Alzheimer's disease, epilepsy,

Example; Fig 22; 194pp; English.
The present invention describes nucleic acid molecules for ror-1,
ror-2, ehk-1 and ehk-2. Also described are the corresponding proteins:
Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor
tyrosine kinases. The present sequence represents rat Ehk-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rat receptor tyrosine kinase Ehk-1.

Receptor tyrosine kinase; Ror-1; Ror-2; Ehk-1; Ehk-2; detection; neurotrophin activity; trkB; proto-oncogene; tyrosine kinase receptor; binding protein; BDNF; NT-3; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA encoding receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       11-FEB-1999 (first entry)

4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7

4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7

HEK8 and HEK11 (R85089-92), respectively, were identified following

isolation of their encoding cDNAs (T02946-49) from a human foetal br.

CDNA library. HEK5, HEK7 and HEK8 show extensive homology to the

catalytic domain of chicken EPH-like receptors CeK5, Cek7 and Cek8.

HEK11 shows no homology to any known EPH-like receptor. Recombinant

HEK receptors (or their soluble extracellular domains) are produced i

expression of encoding sequences in procaryotic or eucaryotic host

cells, and are used to produce antibodies (utilised in diagnostic

assays), or to identify and purify ligands for HEK receptors, or

therapeutically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding EPH-like receptor tyrosine kinase(s) and related vectors, host cells, proteins, antibodies etc., used diagnostically and therapeutically to modulate receptor activation

CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDKI T1 (W03422) and MDKI T2 (W03423), of the novel mouse developmental kinase 1 (MDKI) (see als W03423), a new member of the eck/eph family of receptor tyrosine kinases. Their amino acid sequences were deduced from cDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDKI, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential agents useful for treatment of diseases characterised by abnormal transduction.
                                                                                                                                                                              Mouse developmental kinase 1 MDK1 T2.

Mouse developmental kinase 1; MDK1 T2; receptor tyrosine kinase; RTK; signal transduction; probe; diagnosis; gene therapy; neurodegeneration; neuroproliferation; cancer.
